## A EXPERIMENT RESULTS WITH EVOSUITE

Table 1 shows the evaluation results after adding EvoSuite as a baseline. We use EvoSuite to generate tests for each class that has target statements, with a time limit of 120s per class, and with the same configuration as described in Sebastian et al. [1]. The results show that inline tests generated by ExLi achieve higher mutation score than unit tests from all three sources: developer-written, Randoop-generated, and EvoSuite-generated. Among the three sources of unit tests, EvoSuite-generated unit tests do achieve better mutation score than Randoop-generated ones, though still lower than developer-written ones. ExLi is agnostic to the source of unit tests, and the generated inline tests achieve better mutation scores regardless of the source.

Figure 1 shows the Venn diagram of the mutants killed by ExLi-generated inline tests, developer-written unit tests, Randoop-generated unit tests, and EvoSuite-generated unit tests. Inline tests can kill 279 mutants that are not killed by unit tests. There are 181 mutants killed by Randoop but not by EvoSuite and 1240 mutants killed by EvoSuite but not by Randoop, showing that the two unit test generation techniques are complementary. Figure 2 lists the Venn diagram per project.

## B STUDY OF MUTANTS KILLED BY INLINE TESTS

This section reports our findings from manually inspecting the mutants killed by inline tests but not by unit tests (developer-written and Randoop-generated ones).

We randomly sampled 63 examples to inspect from 710 cases where inline tests kill mutants, but unit tests do not. The reasons for inline tests being able to kill more mutants than unit tests (where they are extracted from) can be grouped into three categories:

- Unit tests lack of good assertions (77.8%).

Some unit tests may only assert some attribute of an object, and the attribute affected by the mutation may not be checked by unit tests. Randoop-generated tests typically have weak assertions, e.g., checking if an object is null or not null. Example:

Method under test:

```
1 public ItemRequest<JsonElement> deleteProjectBrief(String projectBriefGid, List<String> optFields, Boolean optPretty) throws IOException {
2     String path = "/project_briefs/{project_brief_gid}".replace("{project_brief_gid}", projectBriefGid);
3     // mutated code: String path = "/project_briefs/{project_brief_gid}".replace(projectBriefGid, "{project_brief_gid}");
4     ItemRequest<JsonElement> req = new ItemRequest<JsonElement>(this, JsonElement.class, path, "DELETE").query("opt_pretty", optPretty).query("opt_fields",
5         optFields);
6     return req;
7 }
```

Randoop-generated unit test:

```
1 @Test
2 public void test1042() throws Throwable {
3     ...
4     com.asana.requests.ItemRequest<com.google.gson.JsonElement> jsonElementItemRequest95 = projectBriefsBase14.deleteProjectBrief("com.asana.errors.
5         RetryableAsanaError: Not Found", (java.util.List<java.lang.String>) strList86, (java.lang.Boolean) true);
6     org.junit.Assert.assertNotNull(jsonElementItemRequest95);
7     ...
8 }
```

Inline tests:

```
1 public ItemRequest<JsonElement> deleteProjectBrief(String projectBriefGid, List<String> optFields, Boolean optPretty) throws IOException {
2     String path = "/project_briefs/{project_brief_gid}".replace("{project_brief_gid}", projectBriefGid);
3     new Here("Randoop", 53).given(projectBriefGid, "com.asana.errors.RetryableAsanaError: Not Found").checkEq(path, "/project_briefs/com.asana.errors.
4         RetryableAsanaError: Not Found");
5     new Here("Randoop", 53).given(projectBriefGid, "200").checkEq(path, "/project_briefs/200");
6     ItemRequest<JsonElement> req = new ItemRequest<JsonElement>(this, JsonElement.class, path, "DELETE").query("opt_pretty", optPretty).query("opt_fields",
7         optFields);
8     return req;
9 }
```

- Inline tests perform “local” assertions (20.6%).

Given the inputs provided by the unit tests, the program state that would have changed by the mutation are limited to local variables and thus not observable from outside the method. In other words, no assertion in the unit tests can kill such mutants. On the contrary, inline tests allow adding “local” assertions to check the changed program state.

Using different test inputs in the unit tests may help. In the example below, the test inputs from all existing developer-written and Randoop-generated unit tests would set unresolved to “\${p2}”, “value”, “\${malformed}”, “http : // \${hostname} : \${port} /”, “localhost : \${port} /”, “\${system.property}”, “”, none of which can make the return value change after mutation. A test input that sets unresolved to “value” would kill the mutant, but it is not trivial to find such input in all cases.

Example:

Method under test:

```
1 public boolean hasMoreLegalPlaceholders()
2 {
3     int prefixPos = unresolved.indexOf( "${" );
4     // mutated code: int prefixPos = unresolved.indexOf( "" );
5     int suffixPos = unresolved.indexOf( "}", prefixPos + 2 );
6     return prefixPos >= 0 && suffixPos >= 0;
7 }
```

Developer-written unit test:

```
1 @Test
2 public void multipleValuesAreResolved()
3 {
4     Properties properties = new Properties();
5     properties.setProperty( "hostname", "localhost" );
6     properties.setProperty( "port", "8080" );
7     properties.setProperty( "base.url", "http://${hostname}:${port}/" );
8     String value = resolver.getPropertyValue( "base.url", properties, new Properties() );
9     assertEquals( "http://localhost:8080/", value );
10 }
```

Inline tests:

```

1  public boolean hasMoreLegalPlaceholders()
2  {
3      int prefixPos = unresolved.indexOf( "${" );
4      new Here("Unit", 35).given(unresolved, "localhost:${port}/").checkEq(prefixPos, 10);
5      int suffixPos = unresolved.indexOf( "}", prefixPos + 2 );
6      return prefixPos >= 0 && suffixPos >= 0;
7  }

```

- Performance bug not detectable by unit tests (1.6%).

The mutant makes the program less efficient but does not change the semantics of the program (in the following example, mutated condition is always true as long as body is not an empty string, but the then-branch of the if-statement still only replaces “.” to “.”). However, with inline tests, we can directly check if the condition is triggered when it should not, and find such performance bug.

Example:

Method under test:

```

1  protected String generateSetter(OgnlContext context, CtClass newClass, CtClass objClass, ClassPool pool,
2      CtMethod valueSetter, Node expression, Object root) throws Exception
3  {
4      ...
5      createLocalReferences(context, pool, newClass, objClass, valueSetter.getParameterTypes());
6      body = "{" + (castExpression != null ? castExpression : "") + pre + setterCode + ";}";
7      if (body.indexOf(".") >= 0) {
8          // mutated code: if (body.indexOf("") >= 0) {
9              body = body.replaceAll("\\.\\.", ".");
10     }
11     ...
12 }

```

Developer-written unit test:

```

1  public SetterTest(String name, Object root, String expressionString, Object expectedResult, Object setValue)
2  {
3      super(name, root, expressionString, expectedResult, setValue);
4  }

```

Inline tests:

```

1  protected String generateSetter(OgnlContext context, CtClass newClass, CtClass objClass, ClassPool pool,
2      CtMethod valueSetter, Object root) throws Exception
3  {
4      ...
5      createLocalReferences(context, pool, newClass, objClass, valueSetter.getParameterTypes());
6      body = "{" + (castExpression != null ? castExpression : "") + pre + setterCode + ";}";
7      if (body.indexOf(".") >= 0) {
8          new Here("Unit", 639).given(body, "{new java.lang.Boolean(org.ognl.test.MethodTest#getA().isProperty());}").checkFalse(group());
9          new Here("Unit", 639).given(body, "{new java.lang.Integer(((java.lang.Object)$2).hashCode());}").checkTrue(group());
10         body = body.replaceAll("\\.\\.", ".");
11     }
12     ...
13 }

```

Table 2 lists all examples we inspected and their reasons.

Table 2: R0 tests killed mutants that are missed by developer-written unit tests.
